Transportation Planning is the functional area within transportation engineering that deals with the planning, evaluation, and programming of transportation facilities. Today, that planning involves an increasingly complex environment of travel demands, land use patterns, urban form, environmental issues, and regulatory agency requirements.

At RBF Consulting (RBF), Transportation Planning is practiced with the goal of improving coordination between land use and the supporting transportation system.

By working closely with affected communities and regulatory agencies to build project support, RBF efficiently processes projects through complex state and federal review programs. As a result, RBF projects have received state and national recognition for unique solutions to complex transportation challenges.

"A mind is like a parachute.
It doesn't work if it's not open."

*Frank Zappa
Philosopher / Songwriter*
